

Naorem Nganthoiba Singh

Software Product Engineer · Full-Stack AI Developer

Bangalore, India | necrospre@gmail.com | [linkedin.com/in/naoremnganthoiba](https://www.linkedin.com/in/naoremnganthoiba) | github.com/naormeit

PROFESSIONAL SUMMARY

Software Product Engineer with expertise in building scalable systems at the intersection of payments, AI, and distributed infrastructure. Built Anvay, a gasless claim-link remittance protocol on Monad with EIP-712 escrow and a correctness-first security model; Loom-Protocol, an Agent Transfer Protocol with HMAC-SHA256 signing and replay protection; and Aether AI, a 3-tier multi-agent orchestration system. Open-source contributor to APIDash and microg/GmsCore. Seeking an engineering internship to work on systems where correctness, reliability, and scale all matter.

TECHNICAL SKILLS

Languages: Python (Advanced), TypeScript, JavaScript, C++ (Intermediate), Java, Solidity

Frontend: React.js, HTML5, CSS3, TailwindCSS, Vite

Backend: Node.js, Express.js, Mongoose, REST API Development

Databases: PostgreSQL, MongoDB, MongoDB Atlas, SQLite

AI / ML: LLM Orchestration, RAG Pipelines, NLP, Computer Vision, Multi-Agent Systems, Predictive Analysis

Cloud & DevOps: AWS, Docker, GitHub Actions (CI/CD), Netlify, Render

Tools: Git, GitHub, Figma, Bruno, JWT, Bcrypt, Dotenv, Foundry, viem

PROJECTS

Loom-Protocol Jan 2026 – Present

<https://github.com/naormeit/Loom-Protocol>

Agent Transfer Protocol · Python SDK

- Designed and open-sourced an Agent Transfer Protocol for secure multi-agent handoffs, implementing a 3-layer security model: HMAC-SHA256 signing, stateful nonce store, and timestamp-based replay protection
- Engineered an atomic ledger for distributed multi-agent state tracking, achieving zero-loss handoff consistency and full auditability across agent pipelines
- Published a Python SDK with sync and async support; Azure-native mode integrates Cosmos DB for ledger persistence, Entra ID for identity, and Content Safety for policy enforcement

Anvay Oct 2026 – Present

<https://github.com/naormeit/anvay>

Claim-Link Payments Protocol · Monad Metropolis Hackathon

- Built a gasless claim-link remittance protocol on Monad using EIP-712 signed escrow contracts, enabling recipients to collect payments with zero gas and no wallet setup
- Designed a security model where link keys never leave the browser (URL fragment only), each signature binds to a single transfer ID to prevent replay, and the relayer cannot redirect funds to any address other than the one named in the signature
- Integrated a Chainlink CRE oracle workflow for live USD→INR rate feeds, Envio HyperIndex for on-chain event indexing, and WebAuthn PRF passkey accounts with HKDF-derived per-link keys
- Shipped 35 Foundry tests covering front-running, replay, signature malleability, expiry, and fuzz cases; tested against Agora's real AUSD on a mainnet fork

Aether AI Jan 2026 – Present

<https://github.com/naormeit/AETHER-AI>

Multi-Model AI Orchestration & RAG Pipeline

- Architected a 3-tier multi-agent system (Council → Veritas → Arbiter) coordinating GPT-4, Claude, and Gemini via a Plan-and-Execute workflow, routing financial queries to specialized sub-agents
- Implemented a RAG pipeline that retrieves domain-specific context at inference time, grounding 100% of

responses in retrieved evidence to eliminate hallucinations

- Structured the orchestration layer to dynamically select across 3 LLM providers based on query complexity and domain specificity

Paytm Sahayak Mar 2026 – Apr 2026

[https://github.com/naormeit/Paytm-Sahayak-AI-](https://github.com/naormeit/Paytm-Sahayak-AI-Conversational-AI-Intelligent-Automation)

Conversational AI & Intelligent Automation · Meta PyTorch Hackathon

- Developed a conversational AI agent focused on intelligent automation and seamless user interaction across diverse query domains for the Meta PyTorch Hackathon
- Constructed a real-time data processing pipeline using Python, REST APIs, and event-driven architectures, sustaining sub-100ms model responsiveness under concurrent load.
- Integrated specialized AI models with backend services to automate content generation and retrieval tasks, resolving complex multi-intent user queries end-to-end
- Optimized NLP pipelines and fine-tuned model prompts to resolve diverse user intents across high-throughput query volumes

EDUCATION

B.Tech in Computer Science — Software Product Engineering 2024 – 2028

Alliance University, Bengaluru · Kalvium UG Program

ACHIEVEMENTS & EXTRACURRICULARS

- **National Finalist** — Smart India Hackathon (SIH) 2024–25 and 2025–26
- **Zonal Level Finalist** — VIT Hackathon 2024–25
- **Mentor** — SwampHacks XVII 2025–26, guiding teams through AI and full-stack development challenges
- **Open-Source** — Built HabitStack AI (Android productivity app on AWS) and Creditora (Flask/SQLite automated financial eligibility platform)
